

GEOHERITAGE CONFERENCE

3 - 7 APRIL 2022

The Geoheritage Division of the GSSA will be hosting a series of events on 3-7 April 2022 to celebrate the amazing variety of geological features (Geosites) with scientific, educational, cultural, economic and/or aesthetic significance in South Africa. The event will comprise virtual and live field/museum visits, presentations, discussions, a strategy session, as well as the opening of the Morris Viljoen display at the Walter Sisulu National Botanical Garden – “The Origins of Life, Landscapes and Minerals as told by the Rocks of South Africa”.

There are many various stakeholders in, and adjacent to, the Geoheritage space and there are a multitude of organisations that service these disparate stakeholders, each with their own emphasis and urgencies. This conference, primarily, seeks to educate geoscientists about Geoheritage – what it is, where we find it, and how it can enrich our daily lives. Other objectives of the conference are to try and showcase what some of the other stakeholder organisations are doing; to recognise that each organisation has its own requirements, priorities and foci, but that there are common goals that we can all work on in our own way; and to try and raise awareness at a variety of educational institutions and identify ways in which we can all promote our own areas of interest.
